This primer was used with primer A (see ACCO5121) in alphoid PCR amplifications that demonstrated preferential HIV integration in or near alphoid DNA in latently infected Jurkat cells. The invention provides isolated cells that harbour a latent immunodeficiency virus that is transcription competent, that can be reactivated, and that is an in vitro model for latent HIV infection in vivo. The cells are useful for investigating the nature of latent HIV. Such agents are useful for reducing the reservoir of latent HIV. Such agents are useful for reducing the reservoir of latent HIV. Methods are provided of treating an immunodeficiency virus infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated cells that comprise transcription competent immunodeficiency virus e.g. HIV-1, or immunodeficiency virus-based retroviral vector integrated into its genome, useful for identifyir latent HIV activators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Verdin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 19-DEC-2001; 2001US-0341727P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0
```

```
The invention relates to detecting apoptosis in a cell. The method involves detecting a decrease in trans-Golgi network integral membrane protein (TGNP) activity or expression by detecting the decrease in TGNP polypeptide or its homologue, a nucleic acid encoding the polypeptide, a nucleic acid that hybridizes under stringent conditions to the aforementioned nucleic acid, or their complements. The method, polypeptides, nucleic acid, and modulators are useful for treating cancer, an inflammatory disease, an autoimmune disease or a neurodegenerative disease. The present sequence represents a PCR primer for amplifying the human TGNP promoter

X The invention relates to a novel recombinant expression construct encoding a reporter gene operably linked to a promoter from a manma viral or cellular gene induced by a cyclin-dependent kinase (CDK) inhibitor. The construct of the invention demonstrates virucide, cytostatic, neuroprotective, nootropic, antiarteriosclerotic, antiarthritic and nephrotropic activities and may be useful in identifying compounds that inhibit the induction of genes involved viral infection, cancer, renal diseases or age-related diseases incolved alzheimer's disease, atherosclerosis or arthritis, such genes being induced by cyclin-dependent kinase inhibitors. Furthermore, The conmany have gene therapy applications. The current sequence is that of being mammalian including

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ADQ30417,
                                          This invention describes a novel nucleic acid containing a specific segment having at least one region that modulates expression of the VRI (vanilloid receptor type 1) receptor, or a functional derivative, allele or fragment of this region, or a sequence that hybridises to it under standard conditions. The VRI modulator is derived from one or more of positions 221931-22334 of GenBank AL670399, 31673-36359 of AL663116, or 44731-43231 or 36616-33151 of AF188787 and is involved in transmission of pain, particularly in primary sensory neurons. The invention also describes a vector that contains the VRI modulator, host cells containing this vector (other than human germ or embryonal stem cells) and a method for modulator expression of the VRI receptor by introducing the condulator or the vector into a cell that contains the VRI gene. The products of the invention are used for detecting a transcription factor from its binding to a regulatory sequence (or a double-stranded collipson that modulates VRI receptor expression in cludes a sasociated with overexpression or underexpression of the transcription factor. The region that modulates VRI receptor expression includes a binding site for a transcription factor, e.g. MZEI, NEWappaB, NEAT or care used for preferred them, receptor expression includes a containing them,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PCR
 are used for prevention or treatment of pain, also for treating sensitivity disorders, e.g. analgesia, hypalgesia or homosomers, e.g. analgesia, hypalgesia or homosomers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid that modulates expression of the vanilloid receptor-1, useful for control of pain or sensitivity disorders, comprises sequences from control regions of the receptor gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human VR1 exon 1d transcription factor binding fragment

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     with an IL-1 inflammatory haplotype. The method involves detecting at least one allele of the haplotype, where the presence of the allele indicates that the subject is predisposed to the development or has the disease or condition. The invention allows the determination of an individual's likelihood for developing a particular disease or condition associated with interleukin 1 (IL-1) polymorphisms without necessarily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method for determining whether a subject has or is predisposed to developing a disease or condition that is associated with an IL-1 inflammatory haplotype. The method involves detecting at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 361
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or cc assess by association analysis the genotype of an individual or group of cindividuals, having a pathological phenotype trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. cc agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular cdystrophy, familial hypercholesterolaemia, polycystic kidney disease, cc osteogenesis imperfecta and acute intermittent porphyria. Phenotypic craits also include symptoms of or susceptibility to multifactorial confiammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and conternity analysis. The present sequence represents a single nucleotide primer extension (SNPE) primer specific for a human SNP containing DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking semience. The SNPE primer is used to amplify a SNP flanking semience.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7g22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 15p11.2 and MDZ12 is encoded at chromosome 15p11.2 and MDZ12 is encoded at chromosome 15p26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are

profeins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7922.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 15p11.2 and MDZ12 is encoded at chromosome 15p11.2 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for dispnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to novel human zinc finger-containing profeins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC amplification relates to a method of designing primers for simultaneous cc amplification of target DNA fragments in a single multiplex polymerase cc chain reaction by aligning a first primer and a second primer. The method cc comprises (a) aligning a first primer and a second primer, and (b) cc selecting the first primer where the first primer at its 3' end does not contain four or more bases that are perfectly matching to the 3' end cc sequence of the first primer at at its 3' end does not contain seven or more bases that are perfectly matching to the 3' end cc second primer, the first primer at its 3' end does not contain six or contain six or contain six or contain six or the second primer at the first primer at its 3' end does not contain six or contain six or the second primer, the first primer at its 3' end consess that are perfectly matching to a sequence anywhere of the first primer or the second primer, and the first primer at its 3' end con sismatch to a sequence anywhere of the first primer or the second contain exaction. It is also useful for designing primers for simultaneous amplification. It is also useful in the identification of multiple genes chain reaction, the studies in pharmacogenetic reactions, the genotyping conservance contains in a large population, the gene expression contains in a large population, the gene expression this sequence corresponds to an example of a primer of the invention.

The method cc comprises: (a) aligning a first primer and a second primer; and (b) cc selecting the first primer where the first primer at its 3' end does not contain four or more bases that are perfectly matching to the 3' end cc sequence of the first primer or a second primer, the first primer at its 3' end does not contain seven or more bases that are perfectly matching cc except one mismatch to the 3' end sequence of the first primer or the second primer, the first primer at its 3' end does not contain six or cmore bases that are perfectly matching to a sequence anywhere of the first primer or the second primer, and the first primer at its 3' end does not contain six or contain seven or more bases that are perfectly matching except one mismatch to a sequence anywhere of the first primer or the second cc primer. The method is useful for designing primers for simultaneous camplification of target DNA fragments in a single multiplex polymerase chain reaction. It is also useful in the identification of multiple genes related to multifactorial diseases, the genome-scale detection of genetic calterations, the studies in pharmacogenetic reactions, the genotyping confiling in various samples and high throughput genotyping technologies. This sequence corresponds to an example of a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁

cows. The protein is expressed and secreted into the milk as a fusion protein that has reduced biological activity. The animal is then milked and the fusion protein is then cleaved (chemically or enzymatically) to release the desired active protein which may then be isolated and utilized. The use of to recombinantly produce polypeptides in milk minimizes health problems in the animal and prevents side effects associated with ectopic expression or leakage of the protein into surrounding tissues and the circulation. These side effects are a particular risk when producing potent polypeptides such as growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the tumourigenesis genes (T-gene), in the form of PLAG1, PLAG2, and CTNNB1 genes. Their proteins can be used as a starting point for preparing antibodies for clinically/medically diagnosing cells having a non-physiological proliferative capacity as compared to wild type cells, where the former cells are selected from both benign and malignant tumours, as well as leukaemia and lymphomas. Derivatives of the T-gene are also used in the diagnosis and preparation of therapeutical compositions for the treatment of cancers, such as nucleic acid derivatives, and antibodies. The T-gene may be uses as a starting point for designing suitable expression-modulating compounds or techniques for the treatment of non-physiological proliferation phenomena in humans or animals. Expression inhibitors of the T-gene can be used in the treatment
                                                                                                                                                                                                                                                                                                        The invention relates to a new process for producing biologically active polypeptides (e.g. erythropoletin (EPO)) in mammalian milk as fusion proteins that are less active (or non-active) than the free polypeptides. The process may be used for the recombinant expression of proteins (especially EPO) in the milk of transgenic animals such as sheep and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 1; Col 7; 10pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Producing biologically active polypeptides in mammalian milk
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 17-AUG-1994;

                                                                                                                   The invention relates to human chromosomal region 9q11 (AAC87588). Abnormalities in this region of the short arm of chromosome 9 is thought to be associated with miscarriage and cancer, as an ovarian cancer patient with a history of miscarriage was found to have a chromosomal inversion inv(9) (p11;q13). The 9p11 region contains the gene encoding keratinocyte growth factor (KGF), and the invention also specifically claims the KGF PCR primers AAC87589 and AAC87590 for use in detecting all or part of the KGF gene. The nucleic acid sequences can be used to detect abnormalities in chromosomal region 9p11 and thus give an indication of an individual's risk of developing a 9p11-associated condition. Sequences AAC87596-C87597 represent human Alu sequence PCR primers used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   factors, cytokines and enzymes. This means the transgenic animal remains healthy, viable and able to lactate for longer. Sequences AAZ07499-500 represent AHRECASEPO transgene specific primers used for screening GO mice. AHRECASEPO is a gene construct designed to secrete biologically active free human EPO in transgenic mouse milk
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; keratinocyte growth factor; KGF; chromosome cancer; miscarriage; spontaneous abortion; genetic diagnosis; Alu sequence; PCR primer; ss.

                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                This invention describes a novel nucleic acid (NI) encoding a polypeptide which comprises a KRAB-domain and/or at least one zinc finger motif. The products of the invention have cytostatic and antithyroid activity and can be used in gene therapy. Nucleic acids, polypeptides, and antibodies of the invention may be used in the diagnosis and/or the therapy of the malfunction of the thyroid and/or hyperlasias of the thyroid and/or thyroid tumors. They may also be used in the production of medicaments. (NI) can also be used to diagnose thyroid tumors which are located on chromosome 19 at band 19q13. This sequence represents a PCR primer used in the isolation of the thyroid malfunction-associated protein, RITA which is described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        KRAB domain; hyperplasia; thyroid; tumor; zinc finger motif; primer; cytostatic; antithyroid; gene therapy; chromosome 19; 19q13; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human thyroid malfunction-associated protein RITA PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAF88160;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antibacterial, immunosuppressive and antiinflammatory. It is useful for treating a condition in a patient requiring removal or destruction of cells, for treating a condition such as benign or malignant tumor, inflammatory disease, autoimmune disease and infectious disease. The peptide useful for treatment is derived from the amino acid sequence for a pancreatic thread protein. The peptide is conjugated, linked or bound to a molecule chosen from antibody or its fragment, antibody-like binding molecule, where the molecule has a higher affinity for binding to a tumor or other target than binding to other cells. Treatment using NTP peptides can remove benign tumors with less risk and fewer of the undesirable side effects of surgery. The present sequence is an NTP encoding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel neural thread protein peptide, referred as cell death peptide, useful for treating prostatic hyperplasia, psoriasis, eczema, dermatosis, atherosclerosis, cosmetic modification to skin, throat, mouth, muscle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      19-JUL-2001; 2001US-0306150P.

The mouse shows one or more neurological defects similar to the pathological features of an SMAN patient. The transgenic mouse is useful as a model for human spinal muscular atrophy (SMA); in developing and evaluating methods for diagnosing and treating SMA; for testing the accuracy and sensitivity of diagnostic methods for SMA; for testing the efficacy of various present and future therapeutic methods for SMA; and as a convenient positive control necessary for developing and testing any diagnostic methods for SMA. The present sequence represents a PCR primer which is used in the identification of transgenic mice by probing the 5'
New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic

CC includes kits for determining the presence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPB primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by CC performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC oligonucleotides are useful for determining the presence, absence or CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to CC assess by association analysis the genotype of an individual or group of CC individuals, having a pathological phenotypic trait suspected of being CC caused by one or more SNPs. Phenotypic traits include diseases e.g. CC agammaglobulinaemia, diabete sinsipidus, Lesch-Nyhan syndrome, muscular CC diseases imperfects and caute intermittent porphyria. Phenotypic CC osteogenesis imperfects and caute intermittent porphyria. Phenotypic CC disease of which a component is or may be genetic such as autoimmune CC diseases, including, rheumatoid arthritis, multiple sclerosis, pathogenic confirmmation, cancer, nervous system diseases and infection by pathogenic confirmment of also inseril in forencie investications and
                                                                             microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a single nucleotide primer extension (SNPE) primer specific for a human SNP containing DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        primer extension (SNPE) primers, and the sequences of regions of single nucleotide polymorphisms SNPs. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to novel human zinc finger-containing CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p21.3-22.2, CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p21.3-22.2, CC mDZ4, MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, CC or in manufacturing a medicament for treating or preventing a disorder CC associated with decreased or increased expression or activity of MDZ3, CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic CC acids and proteins are also useful for diagnosing or monitoring a disease CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic CC acids can also be used as probes to detect and characterize gross CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are CC useful in constructing microarrays for measuring gene expression. The CC proteins are useful as therapeutic agents for gene therapy or as CC vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human MDZ7 scanning oligonucleotide SEQ ID 5565
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ADB04579 standard; DNA; 25 BP
The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
                                                                                                                                                                                                               New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               20-NOV-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome ibq26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or, in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.
The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7g22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 1fp11.2 and MDZ12 is encoded at chromosome 1fp11.2 and MDZ12 is encoded at chromosome 1fp11.2 and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
The invention relates to proteins TCH131 (human, mouse and rat), TCH182 (human) and TCH120 (human) and their salts and partial peptides, and similar proteins with equivalent activity. Also disclosed are polynucleotides (including DNA) encoding the proteins. Proteins of the invention are useful in the prevention, treatment and diagnosis of respiratory diseases (including asthma and bronchitis), kidney diseases (including kidney failure and nephritis), nervous system diseases (including Alzheimer's, Parkinson's and schizophrenia), metabolic acidosis, muscle diseases (including muscle wasting), allergic diseases (including pneumonia, meningitis and myocarditis), autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                              Monocarboxylic acid and organic ion transport proteins and compounds modifying their activity or expression for treatment, prevention and diagnosis of respiratory, inflammatory, autoimmune, allergic and kiddiseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     07-NOV-2001; 2001JP-00342139

The present invention describes a method for detecting the presence polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to d the presence of genetic polymorphisms associated with inflammatory be disease and correlating their occurrence with disease states. They used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (including muscular dystrophy and multiple sclerosis), allergic diseases (including hayfever), spleen diseases (including spleen hyperfunction), immune deficiency diseases (including leukopenia), liver diseases (including hepatitis), digestive diseases (including Crohn's disease), genital diseases (including ovarian hypofunction) and cancer (including pancreas cancer, lung cancer, non-small cell lung cancer, kidney cancer, liver cancer, ovarian cancer, prostate cancer, stomach cancer, breast cancer, bladder cancer and colon cancer). The sequences given in records aDJ31314-ADJ3242 include proteins of the invention and those related to the invention, polymucleotides encoding these proteins, and primers and probes for the amplification and detection of DNA encoding them.

                                                                                                                                                                                                                    Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking controlled includes kits for determining the present or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC identity of a SNP and for genotyping nucleic acid sample by collective and for genotyping nucleic acid samples. For e.g. to assess by association analysis the genotype of an individual or group of claused by one or more SNPs. Phenotypic trait suspected of being cases by an additionally disbets insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, considerable and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial diseases, including, rheumatoid arthritis, multiple sclerosis, confidence in revusa system disease and infection by pathogenic confidence in concern revous system disease and infection by pathogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia, polycystic kidney disease; osteogenesis imperfecta; autoimmune disease;

                                                                                                                                                                                                                                                                                                                  SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 7975/c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primers AAX83008-X83064 were used to RT-PCR amplify exons from the 5' and 3' ends of the human WRN gene (AAX83003) which encodes a protein related to Werner's syndrome. The products can be used for the detection and treatment of Werner's syndrome (WS), an autosomal recessive disorder with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  detection

The present invention relates to the invention of the polynucleotide sequence encoding it described is the process for preparing the protein by DNA and the application of the polypeptide and polynucleotide

invention relates to the isolation of human zinc and the nolvnucleotide sequence encoding it. F

New human zinc finger protein 10.01 polypeptide for treating malignant tumors, hemopathy, human immunodeficiency virus infection, immunological

diseases and various inflammations.

                                                                                                                                                                                                                                                                         Human; zinc finger protein 10.01; malignant tumour; haemopathy; human immunodeficiency virus infection; HIV infection; inflammation; immunological disease; RT-PCR; primer; reverse transcriptase-PCR; ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to human zinc finger protein 15 (s AAI65097 and AAG78828). The zinc finger protein and its coding s are useful in the diagnosis and treatment of malignant nepplasm, haemopathy, HIV infection, immunological diseases and various inflammations. The present sequence is a PCR primer, which was u example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             мао Y,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the protein and coding sequences of human acid phosphatase family protein 11. The sequences can be used in the treatment of cancer, haemopathy. HIV infection, immune diseases and phlogosis. The present sequence is a PCR primer for the coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              21-JUN-2000; 2000CN-00116667.

The method involves providing a sample comprising a microsatellite of interest; contacting the sample with at least one enzyme having nucleic acid polymerase activity and incubating the sample with the enzyme for amplifying the microsatellite. The method is useful for reducing stutter in the amplification of a microsatellite for genetic analysis. The present sequence is a PCR primer used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                               containing a site-specific recombinase characteristic sequence fragment, and the polynucleotide sequence encoding it. Also disclosed is a process for preparing the polypeptide by a DNA recombination technique and application of the polypeptide and polynucleotide in treating diseases such as growth development disorders and tumours. The present sequence represents a reverse transcriptase-PCR primer used in the examples of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; protein-13.2; site-specific recombinase;

The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotype trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis;
                                                                                                                                             inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a single nucleotide primer extension (SNPE) primer specific for a human SNP containing DNA
                                                                                                                                                                                                                               agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscul dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and the intermit, polycystic kidney disease, osteogenesis imperfecta of controlation in the component of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; Page 57; 83pp; English.

CC primer extension (SNPE) primers, and the sequences of regions flanking concludes kits for determining the presence or absence of a SNP, using the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or clidentity of a SNP and for genotyping nucleic acid sample by performing a pathological phenotypic trait suspected of being CC assess by association analysis the genotypic trait suspected of being CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular cystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial consists and including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and commerce extension (SNPE) primer specific for a human SNP containing DNA commerce extension (SNPE) primer specific for a human SNP containing DNA commerce extension (SNPE) primer specific for a human SNP containing DNA commerce.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          5

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ş
                                                                                             implicated in the pathology of multiple sclerosis. Certain polymorphic sequences in the MMP-9 promoter, coding sequence and 3' untranslated region of the human MMP-9 gene (see AAZ45145) can affect the severity of atherosclerosis. The invention relates to the presence or absence of one variant form of a MMP-9 gene polymorphism (-1562 Cytosine/Threonine), detection of this polymorphism using oligonucleotides AAZ45137-Z45140 can be used for disease prognosis. The invention shows that the MMP-9 C-1562T polymorphism is a regulatory functional polymorphism. The methods and oligonucleotides are used to detect polymorphism in the MMP-9 gene. They are useful for the diagnosis and prognosis of diseases characterized by metalloproteinase mediated remodelling, such as atherosclerosis, tumour invasion and metastasis, inflammatory disease, and neurological diseases, particularly those involving demyelination such as multiple sclerosis, and afformation the MMP-9 gene variants may be and archiritic disease. Proteins encoded by the MMP-9 gene variants may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matrix metalloproteinase-9; MMP-9; polymorphism; endopeptidase; detect; inflammatory disease; diagnose; atherosclerosis; tumour; metastasis; neurological disease; multiple sclerosis; arthritis; ss.

        cancers (e.g. adenocarcinoma, lymphoma, prostate cancer or uterus cancer), immune response, graft-versus-host disease, acquired immunodeficiency syndrome (AIDS), asthma, Crohn's disease, hypertension, congenital heart defects, multiple sclerosis, inflammation or Albright hereditary osteodystrophy and many other diseases listed in the specification. The DNA encoding the protein is useful in gene therapy for treating the conditions. This is also useful in detection assays, or chromosome mapping, tissue typing, diagnostic or prognostic assays, or for developing a powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications. The present sequence is a primer used to isolate DNA encoding a NOVX protein by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       encoding NOVX (or its complement, fragment or variant). NOVX is NOV1-14, 15a, 15b, 16a, and 16b. The NOVX polypeptide, nucleic acid encoding it and antibody against it, are useful for treating or preventing (e.g. by gene therapy) a NOVX-associated disorder in humans, e.g. cardiomyopathy, atherosclerosis, a disorder related to cell signal processing and metabolic pathway modulation, diabetes or cancers. The NoVX polypeptide and nucleic acids are also useful for determining the presence of predisposition to the diseases. The NoVX nucleic acid and polypeptide are especially useful in therapeutic or prophylactic applications for disorders associated with aberrant NoVX expression or activity, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; ss; NOVX; gene therapy; cardiomyopathy; atherosclerosis; cell signal processing disorder; metabolic pathway modulation disorder; diabetes; cancer; adenocarcinoma; lymphoma; prostate cancer; primer; uterus cancer; immune response; graft-versus-host disease; Exon linking; acquired immunodeficiency syndrome; AIDS; asthma; Crohn's disease; hypertension; congenital heart defects; multiple sclerosis; inflammation; hypertension; congenital heart defects; multiple sclerosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SX
                                               cc acids (NAs) comprising contacting a NA sample from a physiological csource, with a pool of 50 distinct gene specific primers under suitable conditions to enzymatically generate sub-population of NAs, where each ceach labeled NA is generated using a single gene specific primer. The care method is useful for producing a sub-population of labeled NAs which is cuseful for analysing the differences in the RNA profiles between several cd different physiological sources, where the method comprises producing cuseful for analysing the differences in the RNA profiles between several cd different physiological sources, where the method comprises producing comprising the populations for each physiological sources, comprising the population, where the comparison is preferably comprising the population, where the comparison is preferably comprising the population, where the comparison is preferably comprised by hybridising the labeled NAs for each of the distinct comparison of a substrate to produce a hybridisation pattern for each of the sources, and comparing the patterns for each of the sources, where cd differential gene expression assays are utilised in differential content tissue or subtissue types. The present sequence is a threat of the source data for this patent did not form part of the printed comparing the pattern did not form part of the printed content the sequence data for this patent did not form part of the printed uspectification, but was obtained in electronic format directly from USPTO are betteronic format as a content part of the printed uspectification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to producing a sub-population of labeled nucleic acids (NAs) comprising contacting a NA sample from a physiological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Producing sub-population of labeled nucleic acids, useful for analyzing differences in RNA profiles between several different physiological sources, using set of distinct gene specific primers.

                                                                                                                                                                                                                                                                                                            The present invention describes a method (M1) of screening for agents, conjugates or conjugate moieties (I), for transport by PEPT2 (an intestinal peptide transporter) transporter (II), comprising poviding a cell expressing (II), contacting the cell with (I), and determining if (I) passes into and/or through the cell by the way of (II). Also described: (I) a conjugate (III), comprising an agent linked to a conjugate moiety that is a substrate for (II), where the conjugate shows a Vmax of at least 1 % of Gly-Sar for (II), where the agent has a pharmaceutical activity without the conjugate moiety, and the conjugate has a greater Vmax for PEPT2 than the agent without the conjugate moiety; and conjugate moiety; and conjugate moiety and conjugate moiety; and conjugate moiety.
                                                                                                                        agent to a conjugate moiety to form a conjugate, where the conjugate is transported by (II) with a Vmax of at least 1 % of the Vmax of the substrate Gly-Sar, and formulating the conjugate with a carrier as a pharmaceutical composition. (III) is useful for treatment, by orally administering (III) to a patient, where the agent exerts a pharmacological effect in the patient who is free of a disease of brain, kidney, lung or spleen. The present sequence represents a PCR primer for human PEPTI, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Screening for agents, conjugates or their moieties for transport by PEPT2 transporter, by contacting cell expressing transporter with the agent, and detecting their passage pass into and/or through the transporter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      11-JUN-2001;

                                                                                                                                                  Ś
                                                                                                                                                                                                                                                                    This invention relates to a novel method for predicting a predisposition to cancer in a patient by detecting large deletions in the human tumour converges of the pressor gene identified as the breast cancer susceptibility gene 1 (BRCAI). Specifically, it refers to deletions that result from the cumequal crossover between a pair of repetitive Alu sequences in the BRCAI consisted the recombined nucleotide sequence containing the confidence of the predisposition to breast and ovarian cancer. The present invention describes newly discovered deletion mutations that are consisted to be deleterious and cause significant alterations in the structure or biochemical function of BRCAI. Accordingly, it provides methods for detecting such mutants, as well as identifying and screening for cytostatic compounds useful for treating or preventing cancers associated with a BRCAI genetic variant. This polynucleotide is a mutant human BRCAI genomic DNA fragment that arises as a result of a crecombination event (deletion 4), which causes the omission of exons 16 cand 17, given in an exemplification of the invention.
                                                                                                                                                                                                 Query Match

The method involves ligating a double stranded DNA structure with a non-complementary region, a 'bubble', in the centre (e.g. see AAT62343-4), to restriction digested fragments of regions containing IREs. The ligation results in a double stranded DNA molecule containing at least one 'bubble' at either end. After denaturing the structure, amplification of the IRE-containing region proceeds by PCR using primers targeted to the IRE sequence (e.g. AAT62347-50) and to the sequence in the 'bubble' region (e.g. see AAT62345). The primer presented here binds to nucleotides 216-236 of the Alu-S polymorphic repeat sequence. The

The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification

Determining the metastatic potential of cancer cells and measuring invasion, comprises introducing cancer cells into the upper chorioallantoic membrane (CAM) and detecting cancer cell migration the upper CAM to the lower CAM. from

WPI; 2001-342659/36

Example; Col 11; 24pp; English.

comprises introducing a canner cell sample into the upper chorioallantoic membrane (CAM) of an avian embryo into which an artificially generated cair pocket has been created, incubating the embryo for intravasation to occur, and detecting migration of the cancer cells from the upper CAM to the lower CAM. The present sequence was used to selectively amplify human specific Alu repeat sequences, which will be present in the cancer cell CAM. DAM but not in the DNA of the CAM. This procedure enables detection of is useful for measuring the metastatic potential of cancer cells, for measuring the ability of the cancer cells into the lower CAM. The method cancer cells to invade blood vessels, and as a drug screening assay for the identification of agents having anticancer cells. The method may also be used to screen for agents capable of cancer cells. The method may also be used to screen for agents capable of cinhibiting cancer cell intravasation, and to detect phenotypic changes. CC effected by genetic manipulation of cancer cells that result in changes The invention relates to a method potential of cancer cells derived for determining the metastatic from a subject with cancer. The with cancer. The method

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WO200257410-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               transferase (UGT2B15), urokinase receptor (uPA), multidrug resistance 1 (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3 (MRP3), orphan nuclear receptor (NR112), or acetylcholine muscarinic receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR3, CHMR4 or CHMR5) sequence. The polymorphisms in the human genes cited in the invention are useful as genetic linkage markers for locating and characterising the genes that are responsible for specific traits within the genome and eventually
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             28-NOV-2000; 2000US-00724389

The polynucleotide of the invention demonstrates antiapoptotic activity and may be useful during gene therapy as an antisense polynucleotide for suppressing the expression of the protein involved in TNF-alpha induced apoptosis and for elucidating the mechanism of TNF-alpha induced apoptosis. The current sequence is that of the human TNF-alpha induced apoptosis-related DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel polynucleotide encoding protein involved in tumor necrosis factor induced apoptosis, useful as probe to acquire perfect length cDNA of generated to TNF-alpha induced apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (GENO-) GENO FUNCTION KK.

CC This invention relates to a novel method for the prediction, diagnosis, CC or prognosis of malignant neoplasia by the detection of at least two CC markers. The invention may also be useful for the development of CC cytostatic compounds through the regulation of the expression of a gene CC or activity of a protein associated with malignant neoplasia. The method CC is useful for prediction, diagnosis or prognosis of malignant neoplasia cuch as breast cancer, ovarian cancer, gastric cancer, colon cancer, CC osephageal cancer, mesenchymal cancer, bladder cancer or non-small cell Clung cancer. The polymucleotides and polypeptides defined in the CC specification, antisense polymucleotides targeting the polymucleotides, CC antibodies targeting either one of the polymucleotides or polypeptides, CC antibodies targeting malignant neoplasia. The disease trated is CC preventing or treating malignant neoplasia. The disease trated is CC preferably breast cancer. The present sequence is that of a PCR primer CC which was used in the exemplification of the invention.

HEALTH & HUMAN SERVICES

This is the nucleotide sequence for the PCR primer used in the amplification of the 3' fragment of the Alu repeat sequence, which is used as a probe in the method of the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into B. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ś
A novel method for simultaneously determining the level of a number of CC target polynucleotides in a sample has been disclosed. The method CC involves forming double stranded copies of the target sequence in direct proportion to the target levels in the original sample. The target CC sequence is copied using primer pairs designed to flank a defined region in the target sequence. The double stranded copies are then cleaved and CC reacted with either first or second adaptor sequences. The first and CC through the target sequences. The adaptor sequences are then removed to leave target sequences. The adaptor sequences are then removed to form ultimer allow expression levels to be determined. This method is useful for developing polynucleotide abundance level profiles for cells and CC tissues under various conditions, stages of development and and disease states, particularly where the target polynucleotide is present at low CC levels. The method may also be used in the discovery and evaluation of CC addition to the method described above, the invention also includes the polynucleotide and polypeptide of P2. P2 is thought to be a member of a convel chemokine family, denoted CXSC and may be associated with immune treatment of asthma, allergic rhinitis (hay fever), urticaria (hives), candidate there shock and conditions involving immune system

CC anaphylactic shock and conditions involving immune system

CC therapy. The human P2 gene has been localised to chromosome 5, within the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cytokine gene cluster at 5q31. The present sequence is the reverse primer P2 for target sequence human P2 gene
                                                                                                                     The invention relates to an isolated polypeptide of human dihydroorotase is comprising a sequence of 137 amino acids or its fragment, analogue or derivative. The polypeptide and the polynucleotide encoding it are useful in the diagnosis and treatment of malignant neoplasm, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammatory diseases. The present sequence is a primer used to isolate a polynucleotide encoding the polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; dihydroorotase 15; cytostatic; virucidal; immunomodulatory; antiinflammatory; haemostatic; anti-HIV; gene therapy; cancer; haemopathy; human immunodeficiency virus; HIV; infection; immunological disease; inflammatory disease; PCR primer; ss.
                                                                                                                                                                                                                                                    New human dihydroorotase 15 for diagnosing and treating malignant neoplasm, hemopathy, human immunodeficiency virus infection, immunological diseases and various inflammations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human dihydroorotase 15 PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     29-NOV-2001
                                                                                                                                                                                                                                                                                                                                                                                                           26-MAR-2001; 2001WO-CN000439

The polymorphism is present in the promoter region, exon 15, introns 2, 5, 15 or 18. HMG-CoA reductase polymorphisms are useful as genetic markers in linkage studies. Detection of the presence of the polymorphisms is useful for assessing the pharmacogenetics of therapeutic compounds in the treatment of HMG-CoA reductase mediated diseases. The polymorphisms are

The polymorphism is present in the promoter region, exon 15, introns 2, 5, 1 or 18. HMG-COA reductase polymorphisms are useful as genetic markers in linkage studies. Detection of the presence of the polymorphisms is usefu for assessing the pharmacogenetics of therapeutic compounds in the treatment of HMG-COA reductase mediated diseases. The polymorphisms are useful for diagnosis of HMG-COA reductase mediated diseases such as a s

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       developmental
                          The invention relates to an isolated polypeptide of ribosome sl9e protein 11 and its corresponding coding sequence. The polypeptide and encoded polynucleotide are applicable in diagnosis and treatment of malignant tumours, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The present sequence represents the reverse transcriptase (RT) PCR primer #2 used in analysis of ribosome sl9e protein II
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; ribosome s19e protein II; cytostatic; virucidal; immunomodulatory; antiinflammatory; haemostatic; malignant tumour; haemopathy; ss; human immunodeficiency virus; HIV; immunological disease; inflammation;

                                                                                                                                                                                                                                 The present invention provides the protein and coding sequences of hum pterin-molybdenum oxidoreductase 10. The sequences can be used in the treatment of cancer, haemopathy, HIV infection, immunological diseases and inflammation. The present sequence is a PCR primer for the coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAI66532 standard;
                                                                                                                                                                                                                                                                                                      New polypeptide for the diagnosis and treatment of malignant neoplasm, hemopathy, HIV infection, immunological diseases and inflammations, comprises the human pterin-molybdenum oxidoredctase 10 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; pterin-molybdenum oxidoreductase 10; cancer; haemopathy;

                                                                                                  Query Match
                                                                                                                                                                   The present invention relates to polymorphisms of the human interleukin 4 receptor-alpha gene (IL4R-alpha; see AAF57718 for the reference sequence). Polynucleotides comprising polymorphic gene variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular IL4Ralpha protein isoform, an expression vector encoding the isoform may be administered to the patient. It may desirable to decrease or block expression of a particular IL4Ralpha isogene, which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high levels of untranslatable mRNA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The present sequence is a PCR primer for human IL4R-alpha

The invention relates to human ATP-dependent serine hydrolase 9 with cytostatic, virucidal, immunomodulatory, antiinflammatory and haemostatic activity. The protein and encoding polynucleotide are used in diagnosis and treatment of malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The polynucleotide is useful in gene therapy. The present sequence is that of a PCR primer, useful to the invention

Human ATP-dependent serine hydrolase 9 and encoded polynucleotide, in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and

                                                                                                                                           Query Match
                                                                                                                                                                                                                                      The present invention relates to protective sequence proteins (ABB44624-ABB44830) and their coding sequences (ABA82701-ABB2937). The sequences, when introduced into a cell either predisposed to undergo cell death or in the process of undergoing cell death, prevent, delay or rescue the cell from death, hence, these sequences are named "protective sequences". The sequences are useful for treating and/or ameliorating cancer, autoimmune diseases and neurological disorders e.g. stroke. Further examples of diseases which may be treated by the present invention are given in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
